

- Set the IP addresses as shown, for PCs and server
- Set the DNS server configuration in PCs config setting
- Enable DNS service in service → services
- Web Browse from PC using the server's IP address assigned which shows the search for the partial IP address
PC → Desktop → web browser → "Enter URL"
- We can add and ~~add~~ edit the web server page by server → services → DNS
- Add domain name and click "Add".
(www.perserverence.com)
- Then we can browse from PC using newly added domain.
- ~~Change~~ Change pinged address by
server → services → http.
